The contrast ratio can be calculated by the following expression.

$$\text{Contrast Ratio (CR)} = L63 / L0$$

L63 : Luminance on the white raster (gray scale level L63)

L 0 : Luminance on the black raster (gray scale level L0)

$$D_{SHA} = |Y_B - Y_A| / Y_A \times 100 (\%)$$

Where:

$Y_A$  = Luminance of measured location without darkest gray pattern ( $\text{cd/m}^2$ )

$Y_B$  = Luminance of measured location with darkest gray pattern ( $\text{cd/m}^2$ )

## Note 6) Measuring setup

The measurement suppose to be executed after stabilized the panel at given temperature during 30 min. The measurement shall be executed 30 minutes after lighting at rating. The luminance of white should be typical luminance ( Typical Condition IL=6.0mA ). In order to stable the luminance, LCD s hall not be got winds.

Note 7) Definition of 13 points white variation  $\delta W$ , CR variation  $\delta C_R$ 

$\delta W$  = Maximum luminance of 13 points / Minimum luminance of 13 points

$\delta C_R$  = Maximum CR 13 points / Minimum CR of 13 points

Note 8) Definition of White Variation dL : measure the luminance of white at 13 × 11 points.

$$dL = [ | L(x,y) - L(x+l, y+j) | / ( L(x,y) \times D(x+l, y+j) ) ] \times 100 \text{ (\%/mm)}$$

where  $2 \leq x \leq 15$ ,  $2 \leq y \leq 11$ ,  $l = \pm 1$ ,  $j = \pm 1$

1. This impedance value is needed for proper display and measured from LVDS Tx to the mating connector.
2. The measuring position is the connector of LCM and the test conditions are under 25℃.
3. The current and power consumption with LED Driver are under the V<sub>led</sub> = 12.0V , 25℃, Dimming of Max luminance and White pattern with the normal frame frequency operated(60Hz).
4. The below figures are the measuring V<sub>led</sub> condition and the V<sub>led</sub> control block LGD used.  
V<sub>LED</sub> control block is same with V<sub>cc</sub> control block.

## 12. General Precaution

Please pay attention to the followings when you use this TFT LCD module.

### 12.1. Mounting Precautions

- (1) You must mount a module using holes arranged in four corners or four sides.
- (2) You should consider the mounting structure so that uneven force (ex. twisted stress) is not applied to the module. And the case on which a module is mounted should have sufficient strength so that external force is not transmitted directly to the module.
- (3) Please attach a transparent protective plate to the surface in order to protect the polarizer. Transparent protective plate should have sufficient strength in order to resist external force.
- (4) You should adopt radiation structure to satisfy the temperature specification.
- (5) Acetic acid type and chlorine type materials for the cover case aren't desirable because the former generates corrosive gas of attacking the polarizer at high temperature and the latter causes circuit break by electro-chemical reaction.
- (6) Do not touch, push or rub the exposed polarizers with glass, tweezers or anything harder than HB pencil lead. And please do not rub with dust clothes with chemical treatment. Do not touch the surface of polarizer for bare hand or greasy cloth. (Some cosmetics are detrimental to the polarizer.)
- (7) When the surface becomes dusty, please wipe gently with absorbent cotton or other soft materials like chamois soaked with petroleum benzene. Normal-hexane is recommended for cleaning the adhesives used to attach front / rear polarizers. Do not use acetone, toluene and alcohol because they cause chemical damage to the polarizer.
- (8) Wipe off saliva or water drops as soon as possible. Their long time contact with polarizer causes deformations and color fading.
- (9) Do not open the case because inside circuits do not have sufficient strength.

### 12.2. Operating Precautions

- (1) The spike noise causes the mis-operation of circuits. It should be lower than following voltage  
:  $V = \pm 200\text{mV}$  (Over and under shoot voltage).
- (2) Response time depends on the temperature. (In lower temperature, it becomes longer.)
- (3) Brightness depends on the temperature. (In lower temperature, it becomes lower.) And in lower temperature, response time (required time that brightness is stable after turned on ) becomes longer.
- (4) Be careful for condensation at sudden temperature change. Condensation makes damage to polarizer or electrical contacted parts. And after fading condensation, smear or spot will occur.
- (5) When fixed patterns are displayed for a long time, remnant image is likely to occur.
- (6) A module has high frequency circuit. If you need to shield the electromagnetic noise, please co-work. When a Back-light unit is operating, it sounds. If you need to shield the noise, please co-work.

### 12.3. Electrostatic Discharge Control

Since a module is composed of electronic circuits, it is not strong to electrostatic discharge. Make certain that treatment persons are connected to ground through wrist band etc . And don't touch interface pin directly.

## 12.4. Precautions for Strong Light Exposure

Strong light exposure causes degradation of polarizer and color filter.

## 12.5. Storage

When storing modules as spares for a long time, the following precautions are necessary.

- (1) Store them in a dark place. Do not expose the module to sunlight or fluorescent light. Keep the temperature between 5℃ and 35℃ at normal humidity.
- (2) The polarizer surface should not come in contact with any other object. It is recommended that they be stored in the container in which they were shipped.

## 12.6. Handling Precautions for Protection Film

- (1) When the protection film is peeled off, static electricity is generated between the film and polarizer. This should be peeled off slowly and carefully by people who are electrically grounded and with well ion- blown equipment or in such a condition, etc.
- (2) The protection film is attached to the polarizer with a small amount of glue. If some stress is applied to rub the protection film against the polarizer during the time you peel off the film, the glue is apt to remain on the polarizer. Please carefully peel off the protection film without rubbing it against the polarizer.
- (3) When the module with protection film attached is stored for a long time, sometimes there remains a very small amount of glue still on the polarizer after the protection film is peeled off.
- (4) You can remove the glue easily. When the glue remains on the polarizer surface or its vestige is recognized, please wipe them off with absorbent cotton waste or other soft material like chamois soaked with normal-hexane.
